

1 新建 requestHolder类

```
public class RequestHolder {  
    public static HttpServletRequest getRequest(){  
        ServletRequestAttributes servletRequestAttributes =  
            (ServletRequestAttributes) RequestContextHolder.currentRequestAttributes();  
        return servletRequestAttributes.getRequest();  
    }  
}
```

2 在 spring boot启动类中加入 Bean配置

```
@Bean  
public RequestContextListener requestContextListener() {  
    return new RequestContextListener();  
}
```
